

Mobile Data – APN Settings for iOS

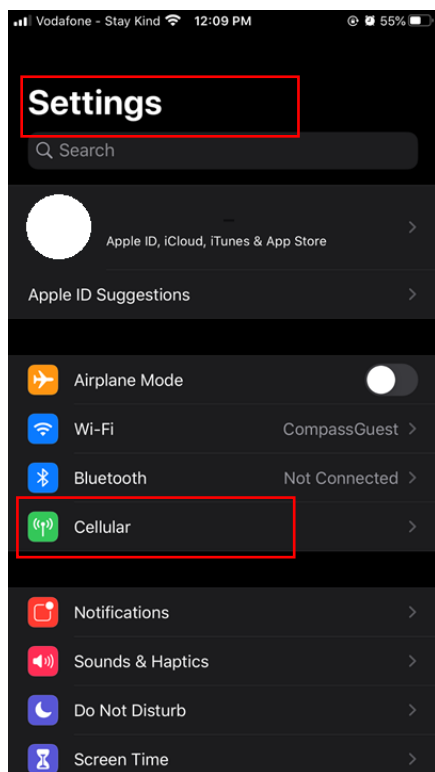

Most of the phones these days come unlocked and not linked to a particular network. That gives you the freedom to choose any mobile carrier. In doing so, sometimes your phone cannot access Data while still being able to make Voice calls. That can be quite frustrating.

The good thing is, it is very easy to fix this by changing the APN Settings of the phone that allows it to create a connection between the carrier's network and public internet. Your mobile carrier will read the APN Settings, once set, and connect you to the correct secure gateway.

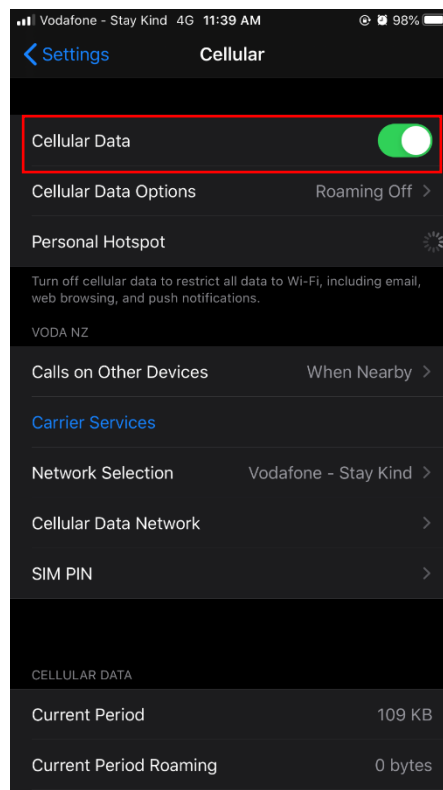

All the heavy lifting is done by us, you will only have to ensure the APN Settings are right in your phone.

You can change the APN Settings in some very easy steps as shown below.

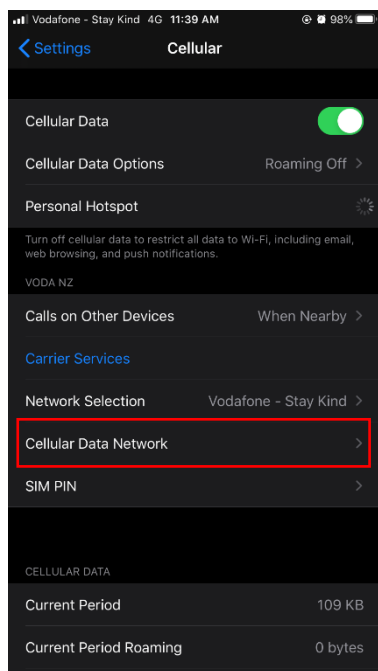

1. Go to your phone <Settings> and <Cellular> or <Mobile>

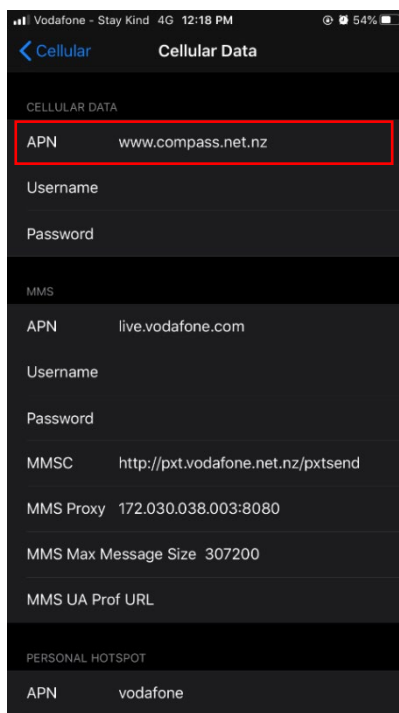

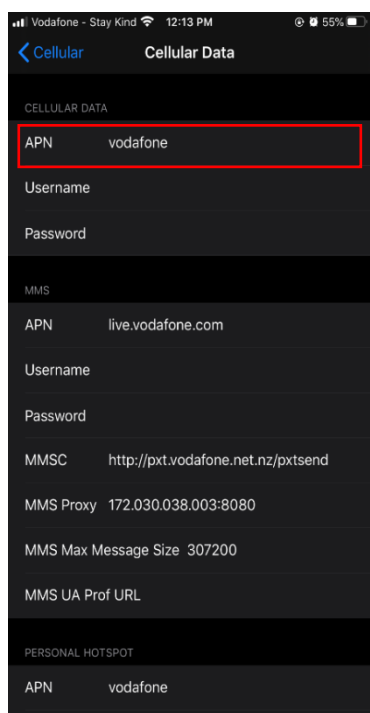

2. Activate <Cellular Data> or <Mobile Data> and select <Cellular Data Options> or <Mobile Data Options>

3. Select <Cellular Data Network> or <Mobile Data Network>

4. Delete <vodafone> and type www.compass.net.nz and **Compass APN** is now set
